

Incident Management Software

Organize and securely store all incident reports on the cloud

A reliable solution to manage your incident reports

Incident reports are vital to a proactive safety policy. OSHA requires employers to report serious incidents immediately and recommends near misses be documented as well. Near miss incidents can bring attention to otherwise overlooked hazards, but unless the incidents are documented and the right people are alerted, near misses can go unnoticed.

That's where incident reporting software can help. It can give you the benefits of trend data, without tying up your administrators in the paper-chasing process. Incident reporting software stores all your incident reports in one secure location with event workflows and can provide informative reports. This easy-to-track data can help fine-tune production by identifying frequent hazards.

Reporting, Tracking, and Accessing Your Incident Reports

Anything you or your team enter in the incident report can be viewed in dashboard reporting or exported into an Excel document. Once exported, the functionality of Excel can influence the organized values your team has gathered using the software. This in turn provides trends, graphs, and pertinent data you can use to bolster your safety strategy.

Customizing Your Incident Management Software

Access pre-built incident reports from the BIStrainer template library or tailor all your own incident management software to your specific needs with easily customizable widget-based tools. Simply drag and drop the fields as required, then provide your team access to the created forms. Once your team starts relaying incidents, you can track those occurrences throughout your entire company.

Major Benefits

Secure Storage

Seamless Data Management

Customizable Forms

Automated Audit Trails

Paperless Workflows

Mobile Access
